

Jacobian eigenvalue trajectory: HG herring latent biomass

Central (m1_stier_11 all_11) + 80-pct posterior band | dashed = 1.0 (neutral); dotted = 2005 closure

Post-closure trend consistent with slow transient return OR persistence near high-biomass state; mechanism not adjudicable. S-map nonlinearity n.s. at $n \sim 75$ (underpowered; SECONDARY only). Hysteresis and long_transient verdicts = INDETERMINATE.
